MP2V-based 2D tracking and position processing based on off-axis TV sensing, camera, and 3D image processing. The setup consists of the handheld MP2V cameras and the 3D Scenario dataset. The evaluation of the proposed algorithm and the comparison with the algorithm of the OpenCV library are presented. Also, the angular uncertainty of the algorithm is measured. Q: How can I use find and sort together? Given a file list like this: PIG PORK PELICAN How can I use find and sort together to output the same results like the first example? I want it to return: A: use shell's default 'sort' command, like this: find /path/to/list/of/files -maxdepth 1 -type f | sort -u you can use find's -exec option, like this: find /path/to/list/of/files -maxdepth 1 -type f | sort -u | xargs -n 1 Hello everyone. I have a "new" view of the various functions of a Unix-like operating system. I see now a way to use different programs, depending on the situation. And even that they must be supplied with their own init scripts. I have a VxLink and a PC-3600 at home, with one Windows 2000 VxLink at work. The VxLink runs as a vz-root, as root, if I want to use it for Win-emulation (or possibly, in another situation, allow the Linux kernel to be present, and allow the Linux kernel to be the OS kernel) I can simply add init=/bin/bash to the kernel command-line, and I'm good to go. In this way I can now have both Linux and Windows on my machines. I can't remember the last time I used the PC-3600. The work PC is a bit ancient for my taste, and I hardly use it. I would say that there is no reason to add another init system. I can boot up to a shell in the real system, then log in as a user, and create a soft-link from /bin/bash to /bin/bash (which is what I normally do).
